

Summit Bechtel Course Guide

For tour leads: build, verify, and manage the course. Works on an iPad, laptop, or iPhone browser — a laptop is easiest for bulk editing. dfreiks-snow.github.io/bechtel-course-guide

1 Unlock Plan mode

- Open the app link. It always starts in **Drive** mode (the driver view); a **Walk** mode (2 mph, trails/car-free roads) is also on the top-left toggle for staff on foot.
- Tap **Plan** (lock icon, top-left) and enter the Plan password (**set by your tour lead**). It unlocks on that device and stays unlocked until you re-lock.
- Tap the **lock button** to re-lock Plan before you hand a device to a driver.

2 Build the course (Plan mode)

- Tap the map where a site is, or use **Drop point at my location**.
- Give each point a **name**, a **category** (each with its own icon — incl. Water, Statue, Housing, Admin, Photo Opp, Platinum Lounge, plus No-drive red X and Park & walk green X), a **description**, **notes**, a **trigger radius** (how close before the card pops), and a **stop time** (minutes to visit, added to the tour total).
- **Close a road or area**: add a point and choose the **No-drive / blocked** category (red X). Its trigger radius sets the no-drive zone, and courses automatically route around it — widen the radius to cover the whole closure.
- **Park & walk** category (green X) marks where drivers park and continue on foot to reach a site.
- **Hit Save to keep a pin**. Closing the editor without saving discards it — nothing is added.
- **Drag** a pin to move it, or type exact **GPS coordinates** (latitude / longitude) in the point editor; reopen a pin to edit or delete it. Moving a red X re-routes affected courses live.

3 Plan, verify & find (Guide + Search)

- Tap **Guide** (compass icon, top-right). Add stops by **tapping points on the map** or the dropdown; reorder with ▲▼, remove with X, optionally loop back to the start. Add ■ **Explore / View** time (top of Add a Stop) for breaks, meals, or dwell — it counts toward the total but is not a map stop.
- **Travel by Drive or Walk** (top of the planner): Drive uses the road speeds below; **Walk** estimates 2 mph and routes over trails and the car-free roads around the Summit Center (may cross no-drive areas).
- Review the **total tour time (driving + stop time) & miles** and the per-leg breakdown before an event (15 mph reserve roads, 20 mph on the approach to the North Entrance, 5 mph activity zones).
- **Search**: tap the search (magnifying-glass icon) in the top bar and type a name to jump the map to any point.
- **Map style**: the layer dropdown (top-right) defaults to **Streets** (or Topo / Satellite); turn on **Settings** → **Show road network overlay** to sanity-check the routing.

4 Save, back up & move courses

- **Save named courses (shared with all admins)**: tap **Save course** in the **Guide** planner or the Plan-mode bar (also in **Settings**), name it, and it stores the points **and** the planned route (stop order + loop). Re-saving the same name overwrites it.
- Saved courses **sync across every admin device** — a course saved on one iPad or laptop appears live for all admins to **Load** or **X delete** (from the Guide planner or Settings).
- **Settings** → **Export course** saves a .json backup; **Import course** loads one. All course tools require **Plan to be unlocked**.
- **Load Summit Bechtel starter points** repopulates the built-in points if you want to start fresh.

5 Prepare devices & share links

- In **Safari** → **Share** → **Add to Home Screen** for a fullscreen app; allow **Location** ("While Using").
- While you still have wifi/signal: **Settings** → **Download this area for offline** to cache map tiles. Add all points first.

- **Share a read-only link:** append **?view=1** to the app URL (dfreriks-snow.github.io/bechtel-course-guide/?view=1) for a **Drive/Walk-only** version — no Plan button, no password, nothing to edit. Safe to hand to riders, families, and volunteers. The plain URL stays the full admin app.

Recommended flow: build & verify the course on a laptop → **Export** a backup → **Import** onto each driver iPad → **Download the offline area** → re-lock Plan before handing off.
