

Summit Bechtel Course Guide

For tour leads: build, verify, and manage the course. Works on an iPad **or** any laptop browser — a laptop is easiest for bulk editing. dfreriks-snow.github.io/bechtel-course-guide

1 Unlock Plan mode

- Open the app link. It always starts in **Drive** mode (the driver view).
- Tap **Plan** (lock icon, top-left) and enter the Plan password (**set by your tour lead**). It unlocks on that device and stays unlocked until you re-lock.
- Tap the **lock button** to re-lock Plan before you hand a device to a driver.

2 Build the course (Plan mode)

- Tap the map where a site is, or use **Drop point at my location**.
- Give each point a **name**, **category**, **short description**, **talking-point notes**, and a **trigger radius** (how close before the driver's card pops).
- **Close a road or area**: add a point and choose the **No-drive / blocked** category (red X). Its trigger radius sets the no-drive zone, and courses automatically route around it — widen the radius to cover the whole closure.
- **Park & walk** category (green X) marks where drivers park and continue on foot to reach a site.
- **Hit Save to keep a pin**. Closing the editor without saving discards it — nothing is added.
- **Drag** a pin to move it; reopen a pin to edit or delete it. Moving a red X re-routes affected courses live.

3 Plan, verify & find (Guide + Search)

- Tap **Guide** (compass icon, top-right). Add stops by **tapping points on the map** or the dropdown; reorder with ▲▼, remove with X, optionally loop back to the start.
- Review **total drive time & miles** and the per-leg breakdown before an event (20 mph roads, 5 mph through activity zones).
- **Search**: tap the search (magnifying-glass icon) in the top bar and type a name to jump the map to any point.
- Turn on **Settings (gear icon) → Show road network overlay** to sanity-check the routing.

4 Save, back up & move courses

- **Save named courses (this device)**: in **Settings**, type a name and tap **Save** to snapshot the current points. **Load** switches between saved courses and X deletes one — saving with an existing name overwrites it.
- **Settings → Export course** saves the whole course (points, notes, radii) as a **.json** file; **Import course** loads one back. Use this to move a course between devices or keep a dated backup.
- Saved courses, Export, and Import all require **Plan to be unlocked**, so a shared driver device can't change your course.
- **Load Summit Bechtel starter points** repopulates the built-in points if you want to start fresh.

5 Prepare devices for the field

- In **Safari → Share → Add to Home Screen** for a fullscreen app; allow **Location** ('While Using').
- While you still have wifi/signal: **Settings → Download this area for offline** to cache map tiles. Add all points first.

Recommended flow: build & verify the course on a laptop → **Export** a backup → **Import** onto each driver iPad → **Download the offline area** → re-lock Plan before handing off. Data lives on each device (it is not synced), so importing is how every iPad gets the same course.
